

Could it be
Ebola?

Ebola virus disease (EVD)

is a rare but often deadly disease.

How Ebola can spread in Humans

- Contact with an infected animal.
- Direct contact with body fluids of someone sick with or who has died from EVD.
- Direct contact with something that has touched the body fluids of someone who is sick with or has died from EVD.

SYMPTOMS

Symptoms can appear two to 21 days after EVD exposure and often include:

- Fever
- Aches and pains including headache
- Sore throat
- Weakness

This is followed by jaundice, diarrhea, vomiting and stomach pain. Skin rash, red eye, and internal and external bleeding may be seen in some individuals.

TRAVEL

EVD is not common in the United States. People in the US usually get it through travel to other countries experiencing an outbreak.

If you have traveled outside of the US in the past 21 days and have any of these symptoms, tell your doctor, nurse or medical provider right away.

Check areas with
outbreaks of EVD at
